## U 124 16-programme IP / FM converter

## U 100 Base unit

Note concerning the U 100-230 base unit:

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

### Caution!

**Changes or modifications of the device not expressly approved by ASTRO Bit Kommunikationssysteme GmbH or any licensed party responsible for compliance will void the user's authority to operate the equipment!**

This operating manual was created to provide the relevant instructions for operating the U114. We expressly recommend reading this manual before installing or operating the device.

The ASTRO company confirms the information in this manual to be correct at the time of printing, but it reserves the right to make changes, without prior notice, to the specifications, the operation of the device and the operating manual. The ASTRO company is not responsible for printing errors. The contents of this operating manual are confidential and protected by copyright. This manual may not be reproduced in any form - not even in part - without prior written permission from the ASTRO company.

## Pictograms and safety instructions

Pictograms are visual symbols with specific meanings. You will encounter the following pictograms in this installation and operating manual:

Warning about life-endangering situations due to dangerous electrical voltage or non-adherence to this manual.

Warning about various dangers to health, the environment and material.

Recycling: all of our packaging material (cardboard boxes, accompanying papers, plastic film and bags) is completely recyclable.

Used batteries must be disposed of at approved recycling points. Batteries must be completely discharged before being disposed of.

Electronic devices must not be disposed of with household waste, but rather – according to directive 2002/96/EG OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL from 27 January 2003, on waste electrical and electronic equipment – must be properly disposed of. When they are no longer of use, please bring these devices for disposal to one of the public collection points for this purpose.

# 1 Figures

The figures show the U 124 installed in the U 100 base device.

## 2 Introduction

The instructions in chapter 2 mainly apply to the U 100 - 230 base device.

### 2.1 Description of functions

The U 100 series is used to convert IP data streams into CATV signals. The U 100-230 base device can accommodate up to three U 1xx signal converters, as well as up to two U 100-SNTs for supplying the voltage to the U 1xx signal converters. The U 124 receives up to four video data streams encapsulated according to the internet protocol (IP) and converts them into up to 16 standardised FM output signals.

### 2.2 Safety instructions

Disconnect both mains plugs before opening the device!

The device must not be opened - for exceptions, see the maintenance and repair, and the service tasks! Power supply units must not be opened!

The device must be connected to a power supply with an earth contact, and should be positioned close to the mains socket.

The electrical system supplying current to the device, e.g. a house installation, must incorporate safety devices against excessive current, short-circuiting and earth leakages in accordance with EN 60950-1.

Both mains plugs are used to disconnect the device from the mains, therefore they must be easy to access and use at all times. The device is already in operation when one power unit is connected to the operating voltage. When the second power unit is also put into operation, one of the power units runs in idle mode as long as the other unit is supplying power to the device. The device may only be repaired by sending it to ASTRO along with a precise description of the error.

Displays indicate the status of the device operation, as well as the existence of DC voltages separate from the mains that are supplying the components of the device. However, operation displays that are not lit up in no way indicate that the device is completely disconnected from the mains or is voltage-free.

Read carefully:

EN 60 728 – Part 11, Safety requirements / No service tasks during electrical storms!

### 2.3 Assembly instructions

The U 100 base device may only be mounted using guide rails! If the device is only fastened by means of the screws in the front panel, this will damage the base device!

The outputs of the signal converter must not be operated without connecting a combining network or terminating impedance!

Protection from environmental factors:

The device must only be connected and operated in dry rooms. It must not be exposed to spraying or dripping water, or to similar phenomena. If condensation appears, wait until the device is completely dry. Objects containing liquid must not be placed on top of the device.

The permitted ambient temperature range is 0 ... 45°C (ETS 300 019-1-3 class 3.1).

Mounting environment:

The device is designed for operation in, preferably, metallically conductive 19" racks with sufficient air convection. It should be operated away from heat radiation and other heat sources. The device may only be installed in rooms in which the permitted ambient temperature can be adhered to, even under changing climatic conditions. To avoid trapped heat, it must be freely ventilated on all sides. You absolutely must avoid mounting the device in a niche or covering the ventilation openings.

## 2.4 Potential equalisation / earthing

The subscriber network must be earthed correctly in accordance with EN 50083-1, and must remain earthed even when the device is removed.

The potential equalisation on the U 100 is effected via the fastening plates of the device, or via the earthing connection on the back of the device. Devices within hand's reached must be incorporated into the potential equalisation among one another.

It is not permitted to operate the device without an earth conductor, device earthing or device potential equalisation!

## 2.5 Maintenance and repair

Disconnect both mains plugs before opening the device!

The device must not be opened other than for repair purposes. In general, power units must not be opened. Repairs may only be carried out at the plant or at workshops, or by persons, authorised by ASTRO Bit GmbH.

Read carefully: DIN VDE 0701- 0702, Repairs

Note: The device must not be opened by the user!

## 2.6 Service tasks

The following tasks, in which screw connections have to be opened, can be performed by appropriately instructed service personnel: Removal and installation of signal converters (e.g. U 124) and power units, also in the operating mode of the U 100.

Replacing power units

After the screws on the cover of the power unit chamber (ASTRO logo) are removed, the power units can be pulled out by hand, forwards along the mounting panel.

When power units are being installed, there should be no contact with the ventilator or the fan grid,

and only the mounting panel attached to the power unit should be used.

When the tasks are complete, the cover of the power unit chamber must be replaced; continuous operation of the device is not permitted without this cover.

Note: Do not put your hand or any objects into the power unit chamber.

The U 100 must only be operated with the original power unit(s)!

Replacing converter modules:

Converter modules can be pulled outwards after the safety screw on the front panel has been unscrewed.

## 2.7 Technical data for mains supply (U 100 SNT - 230 V version)

Mains voltage:	100 – 240 V
Mains frequency:	50 / 60 Hz
Current consumption:	1.4 – 0.7 A per power unit
Protection class according to EN 60529:	IP 20
Permitted ambient temperature range:	0 ... 45°C
Secondary fuse in U100-230:	T3,15A L 250 V IEC 60127-2/3
Secondary fuses in U 124:	SMD, various values

## 2.8 Installing and coding the backplane

The scope of delivery of every U 1xx signal converter includes a backplane to create the physical connection between the signal converter and the base device. Both the mains HF connections and the network connections are connected to this backplane. The temperature controlled fan for cooling the U 1xx signal converter is located on the backplane.

### 2.8.1 Coding the backplane

To correctly define the position of the backplane, and thus the position of the related signal converter in the U 100 base device, the jumper on the board of the backplane, which is described in the following section, must be configured.

Figure 1: Coding the backplane using the jumper

#### Note:

An incorrectly configured jumper leads to incorrect displays in the front LEDs. Additionally, it is not possible to display a correct position on the Web user interface!

## 2.8.2 Installing the backplane

In its state on delivery, the back of the U 100 base device is covered with blind panels:

Figure 2: Position of the blind panel on delivery of U 100

To remove the blind panel, unscrew the two Phillips screws indicated in the above figure and remove the blind panel. The cables now visible must be connected to the backplane coded according to chapter 2.8.1, as shown in the following figure:

Figure 3: Connecting the voltage supply and signal lines

The backplane is now carefully inserted into the free slot of the U 100 base device and screwed in with the Phillips screws of the backplane. Here you must ensure that the cables are not jammed and that the backplane can be installed in the housing with only a small amount of pressure.

Figure 4: Correctly installed backplane

## 3 General introduction

### 3.1 Connecting the U 124 to a PC / laptop

When the operating voltage is connected, or after it is inserted into the slot of the base device, the U 124 switches on automatically. After the boot phase (ca. 90 seconds), the two management IP addresses appear in the display, along with other status messages.

If the device is connected to a PC / laptop via one of the network ports, and if the PC / laptop is suitably configured via the network settings, after you enter the IP address in the address line of the Web browser you can start configuring the U 124.

### 3.2 The Web browser user interface

The Web browser user interface is divided into the top frame, the left frame and the main frame.

The top frame

contains general information about the U 124.

Figure 1: General information in the top frame of the Web browser user interface

This information is as follows:

“SW: 4021” indicates the software level of the U 124 EdgePAL,

“FW: 1.2” is the level of the firmware in the U 124 EdgePAL,

“HW: 1” is the hardware version of the U 124 EdgePAL,

“Up: 0d 02h 36m 12s” is the duration of the connection, measured from the moment of the login,

“Time (UTC):” displays the time of the U 124.

The line in bold for the name, location and contact is made up of the settings in the “User” chapter.

In the right section of the top frame, status information for the U 124 is displayed, i.e. in the Web browser user interface, the latest error message is visible.

Figure 2: View of U 124 Display of the Web browser user interface

The left frame

contains the navigation bar for the various submenus, which are described in detail in the following chapters.

In the main frame,

the submenu is displayed according to the selection made in the navigation bar in the left frame.

## 4 Login

Before the U 124 can be configured there must be a login. This is performed in the "Login" sub-menu.

In the state on delivery, the login data is as follows:

User: admin or user

Password: astro

After correctly entering the login data, you can proceed with the configuration.

Note:

For security reasons, the user names and passwords should be changed from the state on delivery. This prevents unauthorized access.

Only one user / U 100 C can ever be logged into the U 124. At the very bottom of the left frame of the Web browser user interface, the user currently logged in is displayed.

## 5 Status

When you click on the “Status” submenu in the left frame, the following window appears (example):

The screenshot displays the 'ASTRO EdgeFM U124 Status' window. The interface includes a top header with the device name and a left sidebar with navigation options. The main content area is divided into several sections:

- Ethernet:** A table showing network properties, management addresses, and data statistics. A red arrow points to this section with the label 'Ethernet status'.
- IP RX Channels:** A table listing IP receiver channels with details on ports, protocols, and status. A red arrow points to this section with the label 'Status display of the IP receivers'.
- RF Channels:** A large table showing radio frequency channels, including modulators, streams, services, and frequencies. A red arrow points to this section with the label 'Status display of the FM output programme'.
- Miscellaneous:** A table displaying various system status messages, including temperatures, voltages, and power unit status. A red arrow points to this section with the label 'Display of diverse status messages on the module temperature, the internal voltages and the power unit status'.
- System memory:** A table showing memory usage statistics. A red arrow points to this section with the label 'Memory status'.

At the bottom of the window, the text 'ASTRO Strobele Kommunikationssysteme GmbH' is visible.

Figure 3: Status display in the “Status” submenu

## 6 Settings for the IP interfaces, IP management and base device

Reboot: Force reboot.

Figure 4: Overall view

The settings available are described in detail in the following sections.

## 6.1 Configuration of the IP interfaces

In the area of the user interface displayed below you can activate and deactivate the IP interfaces. The connection type is automatically detected and displayed by the U 124. (Here: 1 Gbit/s, full duplex for Data A and 100 MBit/s, full duplex for Management A).

### IP Interface Settings

Property	Management A (eth0)	Management B (eth1)	Data A (eth2)	Data B (eth3)
MAC	00:17:72:02:01:05	00:17:72:03:01:05	00:17:72:04:01:05	00:17:72:05:01:05

Gateway	192 . 168 . 1 . 100	0 . 0 . 0 . 0	0 . 0 . 0 . 0	0 . 0 . 0 . 0

**Note: Please use different IP address settings for each interface.**

Figure 5: IP interface configuration

Changes to the IP addresses must be transferred to the U 124 using the “Submit” button.

Note:

When programming the IP addresses, make sure the addresses are not already allocated in your network. Address conflicts lead to malfunctions in the network.

## 6.2 IP management configuration

In the IP management configuration, the DNS server and the SNTP server are entered. If a valid entry is made under “SNTP server”, this can be used as a time reference. The MPEG flows (TDT) are additional time references.

### IP Management Settings

Property	Value
DNS	192 . 168 . 1 . 100
SNTP server	192.168.1.100 0.0.0.0
Time Source	SNTP Server

**Note: Use 0.0.0.0 for unused or unknown DNS, or SNTP addresses.**

Figure 6: IP management configuration

## 6.3 U 100 settings

Under “U 100 Rack Settings” an address can be allocated to the relevant base device. The number of the currently selected slot is displayed below it:

### U100 Rack Settings

Property	Value
Base Address	2
Slot Address	1
Power Modules	2

Figure 7: Rack settings

If the U 124 is managed using the U 100-C controller and there are several U 100 base devices in use, then each base device must have a different address. The slot address is determined using the backplane coding (see chapter 2.8.1).

## 6.4 Saving and loading a configuration / Default and reboot

The current configuration of the U 124 is always written to the device using the “Submit” buttons, and is therefore activated immediately. If you want to save the current status, you press the “Save 2nd” button. This current status is then saved on the SD card in the U 124. You can call up this status again using the “Load 2nd” button. Saving the configuration on the local computer or FTP server is explained in the “Update” chapter.

Figure 8: Saving and loading / default and reboot

### Save settings to flash / Load settings from flash / Default settings / Reboot system

Save 2nd: All settings are saved to an alternative config.  
 Load 2nd: All settings are loaded from an alternative config.  
 Default: Load factory default settings.  
 Reboot: Force reboot.

The “Default” button is used to restore the factory settings.

Note:

With the factory settings, all the settings apart from the user and network settings of the data and management ports are reset to the state on delivery!

The “Reboot” button restarts the U 124 with the last settings that were entered.

## 7 Configuration of the IP inputs

When you click on the “IP RX” submenu in the left frame, the following window appears (example):

**ASTRO EdgeFM U124**  
**IP RX Channel Settings**

ASTRO Strobel Kommunikationssysteme GmbH

Figure 10: Detailed settings of the IP receiver

To enable the greatest possible path redundancy, the U 124 has various different configuration options for the IP receivers. The Data A and Data B ports can be configured completely independently of one another. IGMPv3 enables what is known as “Source Select”, i.e. the IP receiver can request the data from a preferred source.

Property	Data A (eth2) 1G						Data B (eth3) 1G					
Primary Receive IP Port	○ use	232	19	100	131	10000	☑ like Data A	232	19	100	131	10000
Primary Source Select		0	0	0	0			0	0	0	0	
Secondary Receive IP Port	○ use	0	0	0	0	0		0	0	0	0	0
Secondary Source Select		0	0	0	0			0	0	0	0	

Figure 11: Setting the Multicast addresses

The “use” selection box defines the data source used. This data source is defined via the Multicast address and can - if this Multicast address is provided by multiple senders - be used preferentially by the IP receiver. The IP address of the preferred source is entered under “Primary / Secondary Source Select”. If 0.0.0.0 is displayed here, the Source Select function is deactivated.

If different signal paths are supplied by the same sending equipment, it can make sense to configure Data B exactly like Data A. This is easily performed by activating “like Data A”.

Property	Data A (eth2) + Data B (eth3)	
Enable	<input type="radio"/> on <input type="radio"/> off	
Port	A	automatic
Encapsulation	<input type="radio"/> RTP/UDP/IP <input type="radio"/> UDP/IP	<input type="radio"/> automatic <input type="radio"/> manual
Bitrate	<input type="radio"/> Single PCR (SPTS) <input type="radio"/> Mult. PCR (MPTS)	<input type="radio"/> automatic <input type="radio"/> manual
TSID / ONID	1022	1
Alias manual / automatic		KTO, GlobeCast

Figure 12: Settings for the IP input signal format

In the “Enable” line, the IP receiver is activated or deactivated.

In the “Port” line, the data interface is selected (A or B) and the preferred data interface is set. This function enables the U 124 to switch to the second interface after an input signal has failed, and to switch back when the failed signal has been re-established (prefer A or B). If you select the “auto” option, the IP receiver remains on the substitute interface until it is manually switched back, or until this interface also fails.

Under “Encapsulation” the protocol used in the sender is set: RTP/UDP/IP or UDP/IP. However, the U 124 is also able to detect the protocol automatically and evaluate it accordingly.

For the “Bitrate” you can choose between “Single PCR (SPTS)” and “Multiple PCR (MPTS)”. Here the U 124 can also detect the status automatically and process it.

To have a better overview during the configuration of the HF parameters, you have the option of entering an alias. If this entry option is not used, the first service in the transport stream is automatically used as the alias.

## 8 Configuration of the HF outputs

You go to the overview of the HF parameters via the “RF” submenu in the left frame. All 16 output channels with the related data on the data flow are displayed, as well as the status of the respective FM program. Here the output channel can be activated or deactivated. If you select “Standby” here, only the HF is deactivated. However, the configuration of the output signal remains active, along with the analysis of the input data flow.

Changes must be written to the device by pressing the “Submit” button.

Figure 13: Overview of the HF parameters

If you select the option “On” in the “Reference” column, then the level set in the modulation parameters will be used as the reference value. A deviation of 2.5 dB leads to a warning message, a deviation of 3 dB leads to the output channel being switched off.

You go to the detailed settings either by clicking the relevant channel (e.g. RF 1.1) or clicking the relevant submenu in the left frame.

In the detailed view of a channel, the programme to be converted into FM is selected under “Input Selection”. This programme can be applied from any of the four IP receivers.

Property	Value	Info
RF	on / standby / off Frequency 96.00 MHz Level 0.0 dB Deviation 0.1 dB	
Radio Data System	on / off	
Programme service name	dynamic / static HT RADIO FFH	PS change time 0 s
Programme identification	dynamic / static 0000	
Programme Type	dynamic / static 0	10 Pop M
Traffic Programme identification	on / off	
Music Speech switch	dynamic / static music / speech	
RadioText	dynamic / static	KLINGT FRISCHER
Clock Time and date	on / off source: UECP Service 1.1 TOT IP RX1	

Figure 14: Output channel setting

In the “Stream Selection” area, the PIDs of the PCR are displayed, along with the PIDs of the selected audio stream.

The "Stream Selection" interface shows a table with columns for "Transport Stream" and "PID". The "Service" is set to "IP\_R01 TSID 1113 OND 1 Alias 6-TV MEDIA BROADCAST". The "PID" is set to "0 for manual PID selection". Below the table, there are input fields for "PCR" (set to 0), "Audio" (set to 0), and "RDS" (set to 1025). At the bottom, there are "Submit" and "Reset" buttons.

Figure 15: Stream selection

In the “Modulation” area, all the settings relating to the FM output signal are made:

The "Modulation" interface shows a table with columns for "Property", "Value", and "Info". The "RF" property has a value of "on" (selected) and "standby" (deselected). The "Radio Data System" property has a value of "on" (selected) and "off" (deselected). The "Programme Service name" property has a value of "dynamic" (selected) and "static" (deselected). The "Programme Identification" property has a value of "dynamic" (selected) and "static" (deselected). The "Programme Type" property has a value of "dynamic" (selected) and "static" (deselected). The "Traffic Programme Identification" property has a value of "on" (selected) and "off" (deselected). The "Music Speech switch" property has a value of "dynamic" (selected) and "static" (deselected). The "RadioText" property has a value of "dynamic" (selected) and "static" (deselected). The "Clock Time and date" property has a value of "on" (selected) and "off" (deselected). The "Value" column contains various settings: Frequency (96.00 MHz), Level (0.0 dB), Deviation (0.0 dB), PS change time (0 s), PS (FFH), 0x0000, 0, music/speech, KLINGT FRISCHER, source (UECP Service 1.1), and TOT (IP RX1). The "Info" column contains "FFH" and "10 Pop M". At the bottom, there are "Submit" and "Reset" buttons.

Figure 16: Setting the PAL modulator

“RF” line:

- Activating and deactivating the output signal / Standby: output signal selected and configured by HF switched off
- Selecting the output frequency
- Setting the output level
- Setting the audio hub

Line “Radio data system”:

- Activating the RDS

Line “Program Service name”.

- If the data are available in TS and if the option “dynamic”off is selected, the PS data will also be transmitted. If “static” is selected, you have the option of entering 8 blocks of 8 characters and determining the time interval (min. 3 s). For a static configuration, but a PS is in the TS, the TS data are processed with priority.

Line “Programme identification”.

- If the PI is transmitted on the sender side, then the setting “dynamic” will result in transmission on the output side. If “static” is configured, a sender ID is entered, then this setting is transmitted, until there is a PI on the input side.

Line “Programme type”:

- Transmission of the programme type ID (pop, news etc.). In this case, the PTY in the TS will be transmitted with priority over the manually configured PTY.

- Line "Traffic Programme ident. ": • Activates the transmission of the traffic radio ID
- Line "Music, speech Switch": • Transmits the ID, if provided by the sender, whether music or speech is being transmitted. Accordingly, some end devices can automatically adjust the tone control.
- Line "Radio text" • Transmits, if provided by the sender, the radio text. If "static" is configured and a text entered, this will be transmitted, until radio text is dynamically transmitted by the sender.
- Line "Clock time and date": • If this option is activated, then the display of the current time will appear in the receiver. The radio service in TS or the IP RX can be used as the synchronisation source ("source"). If both sources are configured, the TS is evaluated first and then the IP RX.

## 9 User administration

You reach the user management by clicking on the “User” submenu. The U 124 allows you to create four different users. In the state on delivery, “admin”, “user” and “bc4” are created, all with the password “astro”.

Note:

For security reasons, the user names and passwords should be changed from the state on delivery. This prevents unauthorized access.

In the “Timeout” line the minutes are entered until the U 124 automatically logs the user out if no configuration change has been registered during this period.

In the lower area of the “User Administration” table, you can enter the name, location and responsible contact person. These entries also appear in the top frame.

The screenshot shows the ASTRO EdgeFM U124 User Administration web interface. The top header bar is blue and contains the ASTRO logo, the device name 'ASTRO EdgeFM U124', the title 'User Administration', and system status information including time, uptime, and IP addresses. A sidebar on the left lists navigation options like Status, Logout, Main, IP RX, and RF. The main content area is titled 'User Administration' and contains a table for managing four accounts. The table has columns for Property, Username, New Password, Retype New Password, and Delete. Below the table, there are fields for Timeout, Name, Location, and Contact. A 'Submit' button is at the bottom. A red note warns that there is no hidden password and that users must not forget their passwords or they will be locked out.

Property	Username	New Password	Retype New Password	Delete
Account 1	admin			
Account 2	user			
Account 3	controller			
Account 4				

Timeout: 30 minutes

Name: ASTRO EdgeFM U124

Location: Headend in Cablecity

Contact: John Doe, admin@example.com

Leave input box empty to keep settings. To disable account 2, 3 or 4 set an empty username. Please use no passwords shorter than five characters.

**Note: There is no hidden password. Do not forget your password or you will be locked out.**

ASTRO Strobel Kommunikationssysteme GmbH

Figure 17: User management

Changes must be transferred to the U 124 using “Submit”.

## 10 Transport stream (TS) analyzer

The U 124 can be equipped with a Transport Stream Analyzer by obtaining a licence. This Analyzer displays the structure of the MPEG2 TS, from the tables to the individual PID and its service. You click on the “TS Analyzer” submenu to reach the selection of the transport stream to be analysed. When you select a TS in the “Analyze” line and press the “Submit” button, the selected transport stream is analysed.

ASTRO Strobel Kommunikationssysteme GmbH

Figure 18: Transport Stream (TS) Analyzer view

The optionally available TS Analyzer provides an effective way of checking that the IP input signal is complete, as regards the services / tables it contains. When an analysis has been started, it can take several minutes to complete. In particular, the analysis of the EIT (Event Information Table) can take somewhat longer.

A data stream can be received with CBR (Constant Bit Ratio) in the U 124, or with VBR (Variable Bit Ratio). In any case, CBR is used in MPTS (Multiple Program Transport Stream), but also in SPTS (Single Program Transport Stream). However, SPTS can also be sent with VBR.

Under “Packet Mode” you can choose between “continuous” or “burst” for the configuration of the respective ASI outputs after the IP RX.

The TSID and ONID are displayed according to the transport stream selected, and an alias can be entered for a better overview of the transport streams (see also Figure 11). If no alias is entered, the name of the first service of the transport stream appears.

## 11 Licencing

Some functions of the U 124 (e.g. the TS Analyzer) must be activated using a licence key. The licence key can be obtained from ASTRO along with the function. The text sent is then copied into the text input field and transferred to the device using “Submit”.

The screenshot shows the web interface of the ASTRO EdgeFM U124. The top header bar is blue and contains the ASTRO logo, the title "ASTRO EdgeFM U124", and the "Licensing" menu item. Below the title, there is a status bar with the following information: "Time: 25 Oct 2010 10:51:48 UTC, Up: 0d 02h 36m 47s, ASTRO EdgeFM U124 SW:4021 FW:1.2 HW:1", "Name: ASTRO EdgeFM U124, Location: Headend City, Contact: kontakt@astro-kom.de", and three status indicators: "ASTRO EdgeFM U124", "MgmtA: 192.168.1.221", "MgmtB: 192.168.5.221", and "user is logged in".

The left sidebar contains a menu with the following items: "Status", "Logout", "Main", "IP RX", "IP RX1", "IP RX2", "IP RX3", "IP RX4", "RF", "RF1.1", "RF1.2", "RF1.3", "RF1.4", "RF1.5", "RF1.6", "RF1.7", "RF1.8", "RF2.1", "RF2.2", "RF2.3", "RF2.4", "RF2.5", "RF2.6", "RF2.7", "RF2.8", "User", "TS Analyzer", "Licensing", "Update", "System Log", "Statistics", "Network", "User on 192.168.1.40 is logged in.", and "Timeout in 1780 s".

The main content area is titled "Licensing" and contains the following text: "This device has the HWD 00:17:72:02:01:05 and you have already licensed: 0 IP TX, 4 IP RX, TS Analyzer". Below this text is a text input field and two buttons: "Submit" and "Reset".

Figure 19: Input mask for licence key

To order additional licences, you must enter the MAC address of the device. You will find the MAC address on the Web browser interface, in the “Licensing” submenu (HWID). After the MAC address is passed on, the licence keys are generated at the ASTRO company and issued by e-mail or on a CD.

The format of a licence key is a text document (e.g. Lic001772000222.txt). You can use copy / paste to copy the key(s) into the input mask and press the “Submit” button to transfer the licences to the U 124. If the licence is valid, this is confirmed with the message “License is valid”. An error message is displayed for an invalid licence.

## 12 Software update / saving and loading a configuration

When you click on the “Update” submenu in the left frame, the following window appears (example):

Figure 20: Action selection in the “Software Upgrade” submenu

Here you have the option to store the configuration of the U 124 on an FTP server.

Clicking on the “Update” submenu takes you to the settings for the U 124 software update. In the “(T)FTP Server address” line you enter the (T)FTP server address at which the current software for the U 124 is stored.

In the “Protocol” line you can choose between “FTP” (File Transfer Protocol) and “TFTP” (Trivial File Transfer Protocol). If you choose the “TFTP” option, it is not necessary to enter the user name and the password.

Under “Path” you must enter the path under which the U 124 software for the update was stored. You must ensure that the software is stored in the path entered (with “/” at the start and the end), otherwise no update is performed. You must also ensure that any firewall installed allows (T)FTP communication.

The “Update” submenu also provides the option to save the configuration of the U 124 on an FTP server, or to load a configuration into the U 124. Loading a configuration into the U 124 does not affect the settings of the IP interfaces.

### 13.1 Update using example of a TFTP server for Windows

If no fixed (T)FTP server is set up for updating the U 124, you also have the option to transfer locally saved update files onto the device. Here it is recommended to use a TFTP programme. The procedure is described in the following section using the “Tftpd32” programme.

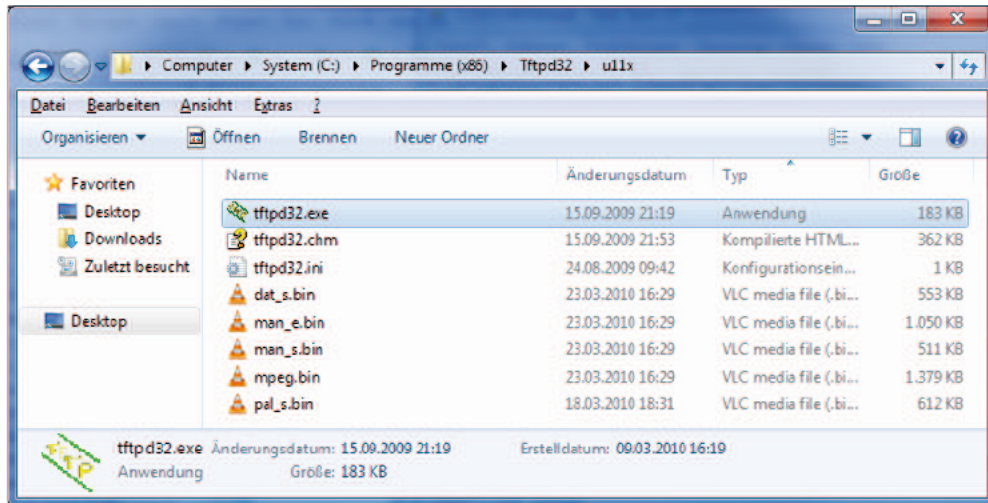

Figure 21: Example view of the U 124 update folder with update files and “tftpd32” TFTP programme.

The “tftpd32” programme is started directly from the folder with the U 124 update files. In the window that appears, you first press the “Settings” button, then enter the settings according to Figure 21:

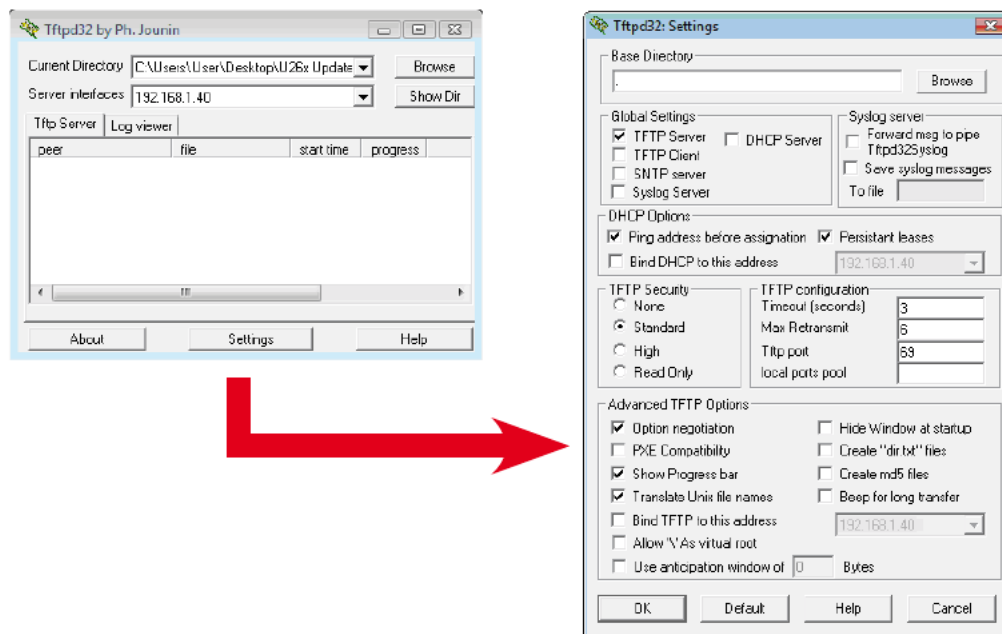

Figure 22: Settings for the tftpd32 TFTP programme

To start the update, the IP address of the local computer must be entered as the server address in the line “(T)FTP Server address” (Figure 23), and the protocol set to TFTP. Thus it is no longer necessary to enter a user name and a password. In the “File” line you now select the option “Update” and press the “Submit” button to start the update.

#### NOTE:

A reboot or a network failure during an update process can cause the U 124 software to crash irrevocably. The device then has to be returned to ASTRO for repair.

## 13 System log

Clicking on the “System Log” submenu takes you to the log of the U 124. All the procedures relevant to the operation of the device are documented here. Additionally, the SNMP settings are made here (defining the trap recipients, the trap community & the trap filter). Also, the “Log file filter” line can be used to define which events lead to an entry in the log.

Figure 23: System log settings

The SNMP MIBs available are stored on the U 124 and can be downloaded from the device.

The operations in the system log are sorted by the time they occurred. To delete the log file, you set the flag for “Check box to clear log on refresh”, then click on the “Refresh” button. The first entry in the log is then the deletion operation, together with the time and the user account, as well as the IP address of the user.

NOTE:

- Downloading the IP configuration via the link “ip.xml”
- System settings via the link “settings.xml”
- System entries via the link “status.xml”
- Module information via the link “module.xml”

## 14 Statistics

Clicking on the “Statistics” submenu takes you to the statistics for the data transfer of the U 124. Here all the statistics relevant to the operation of the device and its analysis are displayed.

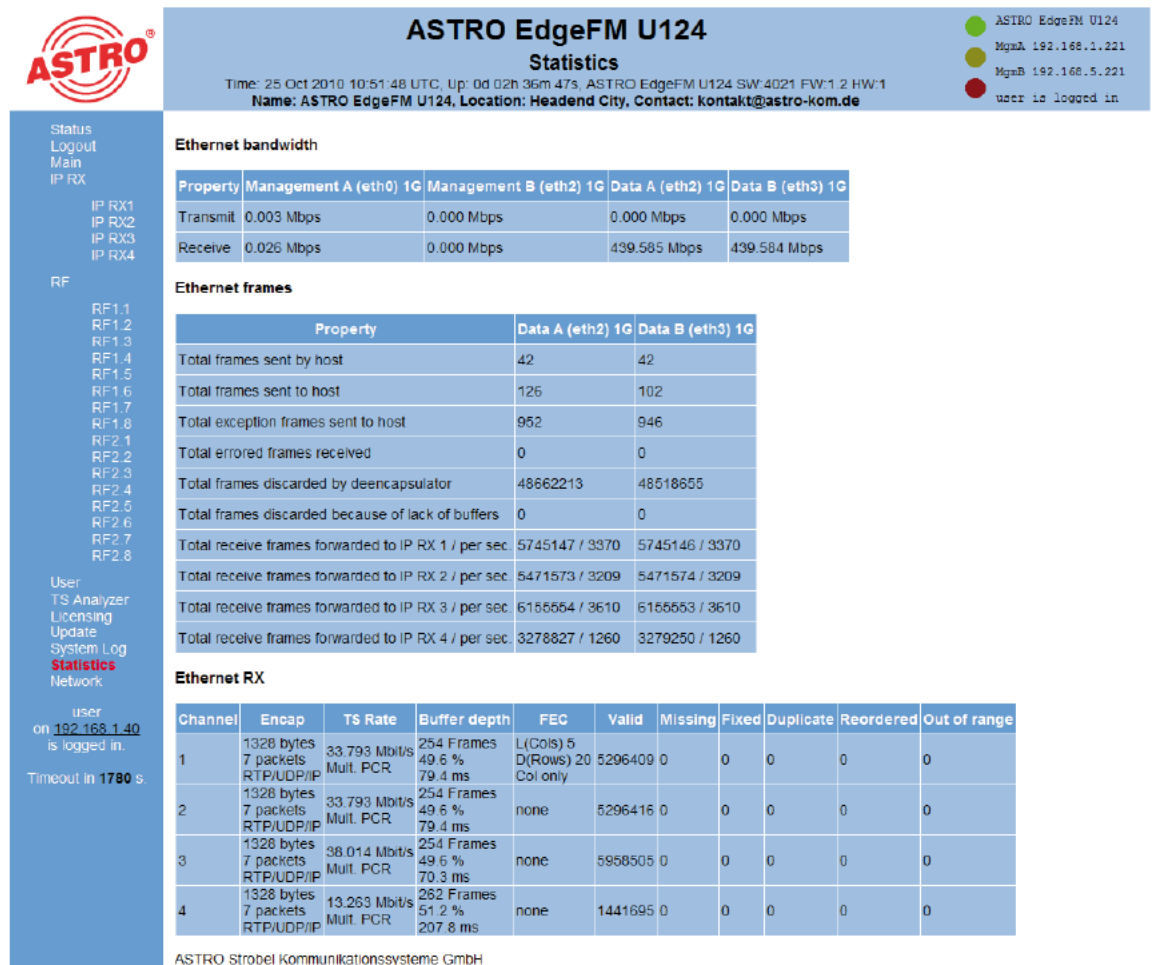

Figure 24: Statistics for the data transfer

# 15 Network properties

You reach the network properties by clicking the “Network Monitor” submenu. The properties displayed are purely for information purposes, and are used to describe the network.

## 16 Logout

Clicking on the “Logout” submenu (only available when you are logged in) takes you to the logout of the U 124.

### User Logout

Are you sure?

Figure 26: Logging out of the U 124

If you confirm the request by clicking “Yes”, you are logged out. No further settings can be made without logging in again, but you do have the option to view the settings of the U 124. However, the setting elements are inactive.

## 17 Technical data

Type	U 100 - 48		U 100 - 230
Order number		380 100	380 101
Network interfaces (forwarded passively to U 1xx)			
Management		2 x 100 Base-T Ethernet (RJ 45)	
Data		2 x 1000 Base-T Ethernet (RJ 45)	
Protocol		IEEE802.3 Ethernet, RTP, ARP, IPv4, TCP/UDP, HTTP, SNMP, IGMPv3	
Transport stream processing			
TS capsulation		UDP, UDP / RTP, 1-7 packets, FEC	
Transport stream processing		transparent (188 or 204 packets)	
Control and management			
Properties		Control via HTTP / WEB	
Protocol		HTTP / SNMP (error messages)	
General data			
Input voltage	[V]	- 48 V DC	100 - 230 V AC
Power consumption	[W]	depends on equipment	
Housing		19" / 1 HE	
Permitted ambient temperature	[°C]	0...+45
